AB - J08295654 Purificn. of aniline comprises contacting phenois-contg. aniline soln. with dil. aq. soln. of alkali. Phenois-contg. aniline soln. is prepd. by hydrogenation of nitrobenzene. The concn. of alkali in the aq. layer after contacting a soln. of aniline with an aq. soln. of alkali is 0.1-0.7 wt. %. The molar ratio of alkali to phenois is 3-500. Sodium hydroxide or potassium hydroxide are pref.

 ADVANTAGE - Colourless aniline with little phenois is prepd. without such problems as handling waste oil with high b. pt. and corrosion of distn. tower.

In an example, an aq. soln. of sodium hydroxide was added to a reaction soln. of aniline (concn. of NaOH in the aq. layer is 0.16 wt. %), which was mixed and sepd. into aq. layer and oil layer. The oil layer was distilled to give purified aniline with phenoi content of less than 5 ppm.(Dwg.0/0)
